Nonylphenolic compounds

\[ \text{NPnEO} : n = 1 - 50 \]

Non ionic surfactants ➔ detergents, wetting agent

World consumption: 500,000 tons in 2000

(Ying et al. 2002)

Endocrine disrupting compounds

Key role in estrogenic activity of surface water

(Marcial et al. 2003 ; Fernet et al. 2003 et Jugan et al. 2009)

European legislation: Directive 2000/60/EC and 2008/105/EC

- 4-nonylphenol (4-NP)
- Environmental quality standard (EQS)
  - Annual average value (AA-EQS): 300 ng/L
Simplified biodegradation of NPnEO

Non-oxydative

Oxidation of ethoxylate chain

Oxydative

Increasing toxicity and estrogenic activity

Giger et al. 2009
How simulate annual time series of concentrations of nonylphenolic compounds in surface water?

Methodology

1. Assessing the *in-situ* biodegradation rate constants (see poster)
3. Building scenarios for the middle (2050) and late (2100) 21st century
Site and sampling campaigns

Study site:
Seine River downstream of Paris, France
40 km transect from Bougival to Meulan
2 lateral inflows:
- Seine Aval WWTP (19 m$^3$/s)
- Oise River (95 m$^3$/s)

Sampling campaigns:
11 monthly sampling campaigns
From Feb. 2010 to Feb. 2011

Analysis protocol:
Extraction: Solid Phase Extraction
Analysis: UPLC-MS-MS
- quantification: 4-NP, NP$_1$EO and NP$_1$EC
- semi-quantitative: NP$_n$EO (n= 1-15)

2 extreme projections: **APR** et **MPI** (rainfall, evapotransp., temperature)

Seine River flow rate by 2050 for a dry and wet year (MPI)
Forecast of global change impacts

Assessment of global change scenarios by 2050 and 2100:

Population growing:

Data from National Institute of Statistic and Economic Studies (INSEE):

➢ + 12 % by 2050 and + 26 % by 2100

➢ Seine Aval WWTP: 19 m$^3$/s in 2010, 22.6 m$^3$/s by 2050 and 24.3 m$^3$/s by 2100
Forecast of global change impacts

Assessment of global change scenarios by 2050 and 2100:

Optimisation of Seine Aval treatment:
Two scenarios:
- Baseline (Base): Seine Aval non optimised by 2050
- Optimised (Opt): Seine Aval optimised by 2050

Cladière et al. (2013) ESPR
Concentrations at Meulan by 2050

Dry year

Significant influence of global changes during low-water period (summer, autumn)
Concentrations at Meulan by 2050

Dry year

Optimisation of Seine Aval treatment compensate the influence of global changes
Concentrations at Meulan by 2050

Wet year

Significant decreases of concentrations in spring because of the river flooding
Concentrations at Meulan by 2050

Wet year

Concentrations for wet year by 2050 << concentrations found in 2010 at Meulan

28/06/2013
Conclusions

First study coupling analytical chemistry and a hydro-ecological model for assessing annual concentrations of pollutants in river water

Modelling for 2010:
- Efficient method to assess concentrations of nonylphenolic compounds in Seine River
- The AA-EQS of 4-NP is not exceeded in the Seine River downstream of Paris

Forecast for the 21st century:
- Similar trends are found for 2050 and 2100 but more pronounced for 2100

Dry years:
- Low water periods are a key issue for the 21st century
- AA-EQS could be exceeded downstream of the studied transect → biodegradation of NP₁EC
- Optimisation of wastewater treatment is a good solution to compensate low-water influence

Wet years:
River flooding lead to significant decreases of concentrations during spring (April, May)
Outlooks

Method limits for annual modelling:
- Include wet weather urban sources for annual modelling
- Include the variability of concentrations of Seine Aval effluent
- Introduce a variability of biodegradation according to the microbial biomass (poster)

Forecast for the 21st century:
- Mature our scenarios (land use, reuse of treated water, new technologies, NPnEO uses…)
- Extend the simulated transect from Paris to the estuary (see impact of biodegradation)
- Consider the increase of water temperature on biodegradation of compounds
Thank you for your attention
